Presented to the CARTS 2013 March 26, 2013, Houston, TX

Hybrid Capacitor Map

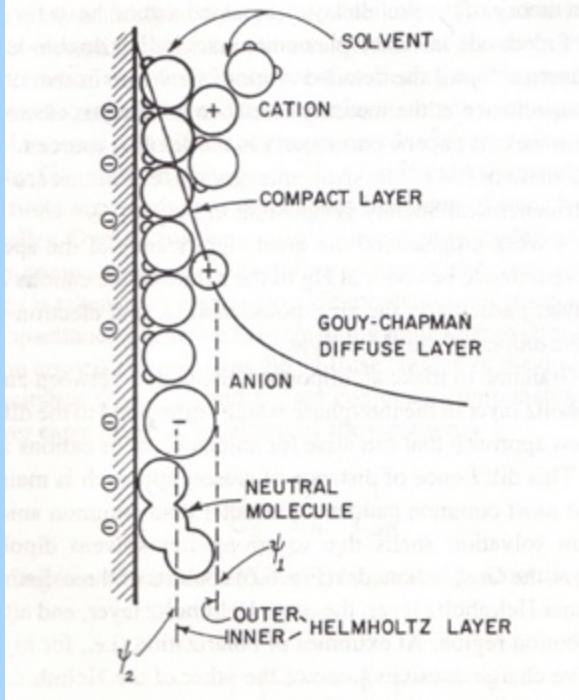

Ragone Diagram

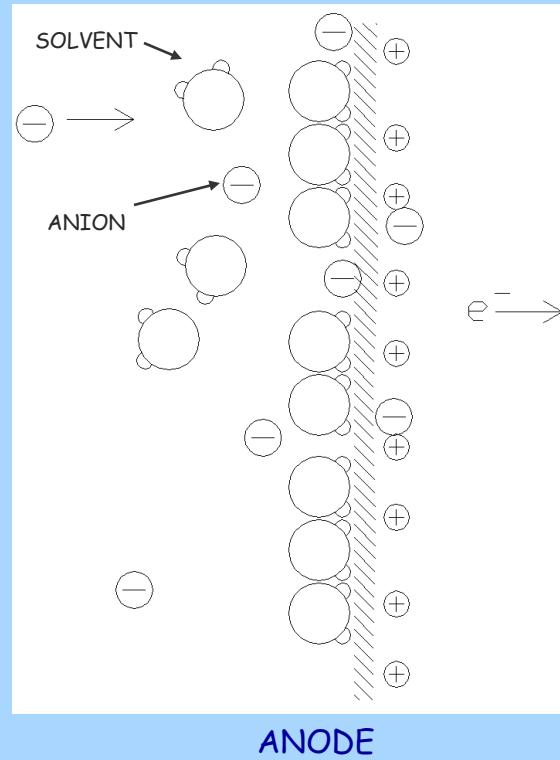

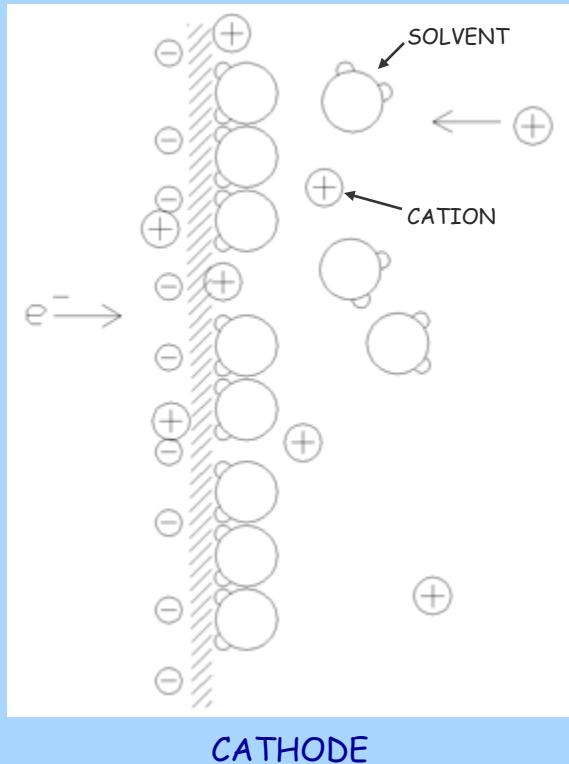

Electric Double Layer

Source: B.E. Conway, "Electrochemical Supercapacitors"

- Exists at every charged electrolyte interface
- Equivalent charge separation about the size of a solvent molecule
- Maximum cell voltage < solvent breakdown voltage
- Small separation results in high series capacitance
- Can often be ignored in calculation of cell capacitance

Faradaic Charging

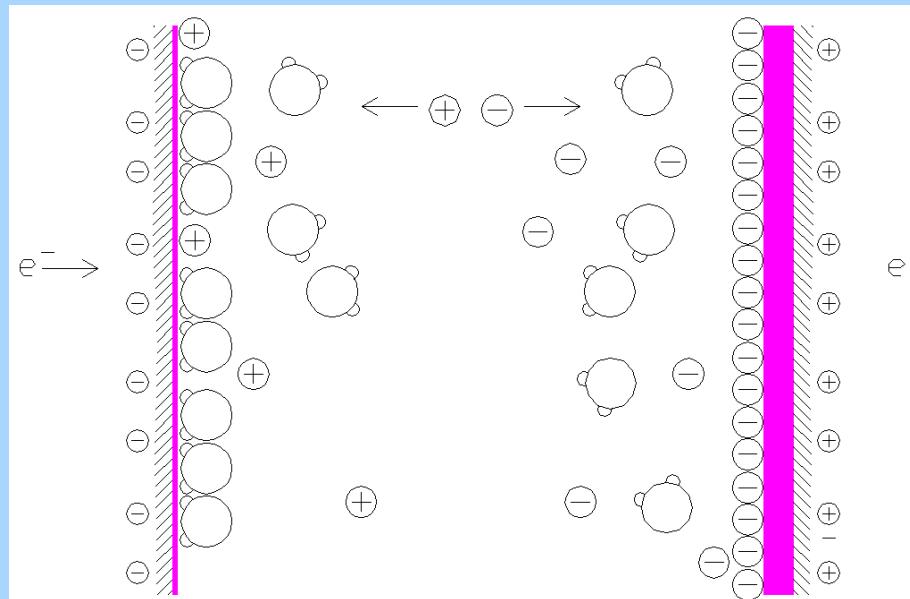

CATHODE

ANODE

Electrolytic Capacitor

- $C = k\epsilon_0 A/t$
- Equivalent dielectric charge separation about 1 nm / volt
- $k = 27$ for tantalum oxide, 9.3 for aluminum oxide
- Series EDL ever present while electrode is charged

Hybrid Tantalum Capacitor

- One electrode stores charge faradaically in a reversible reaction involving the electrolyte.
- The other electrode stores charge electrostatically.

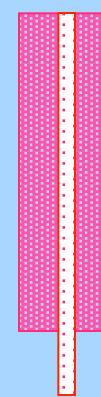

Faradaic Electrode

- RuO_2 on Ta foil
- $\text{RuO}_2 + e^- + \text{H}^+ \leftrightarrow \text{RuO}\cdot\text{OH}$
- Low voltage charge storage

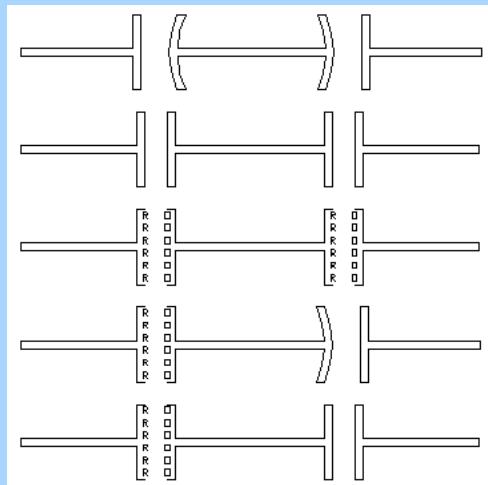

Electrostatic Electrode

- Ta_2O_5 on Ta pellet
- $C = k A/t$ $E = \frac{1}{2} CV^2$
- High voltage charge storage

Electrochemical Capacitors

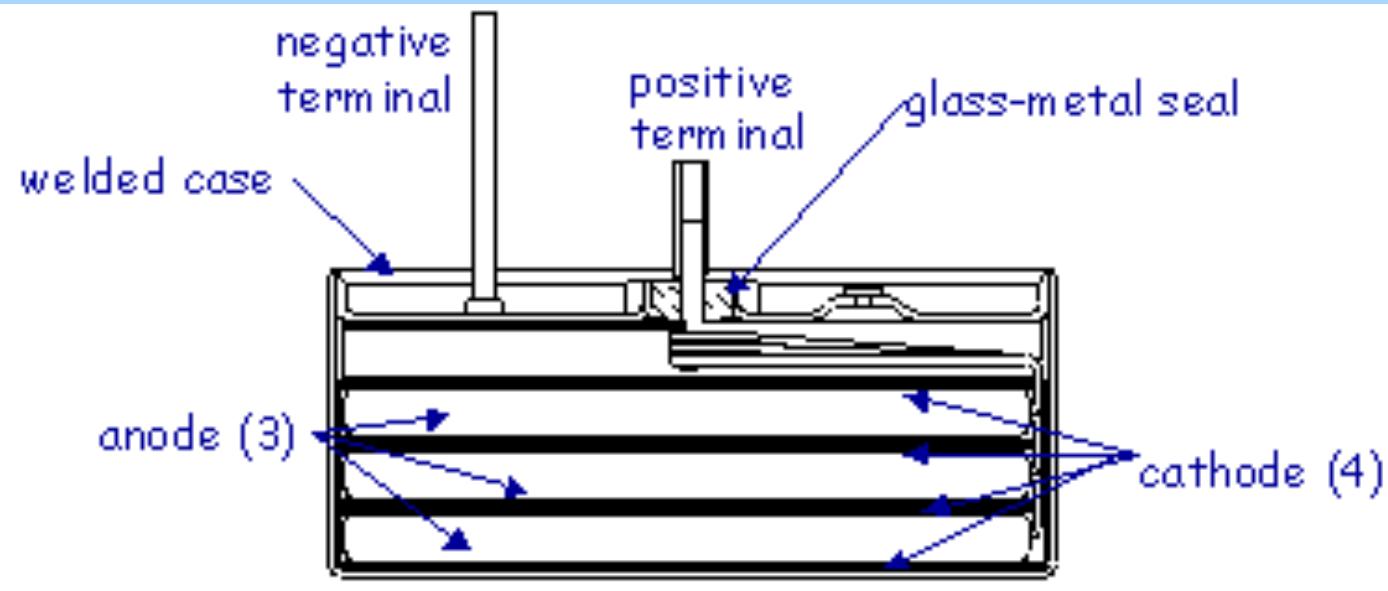

Device	Charge Type	Cell Voltage	Energy Density
A. Electrolytic Capacitor	Electrostatic	High	Low
B. Double Layer Capacitor	Electrostatic	Low	High
C. Pseudocapacitor	Faradaic	Low	High
D. Hybrid Electrolytic	Hybrid	High	Med.
E. Hybrid Electrochemical	Hybrid	Med.	Very High

Tantalum Hybrid Capacitors

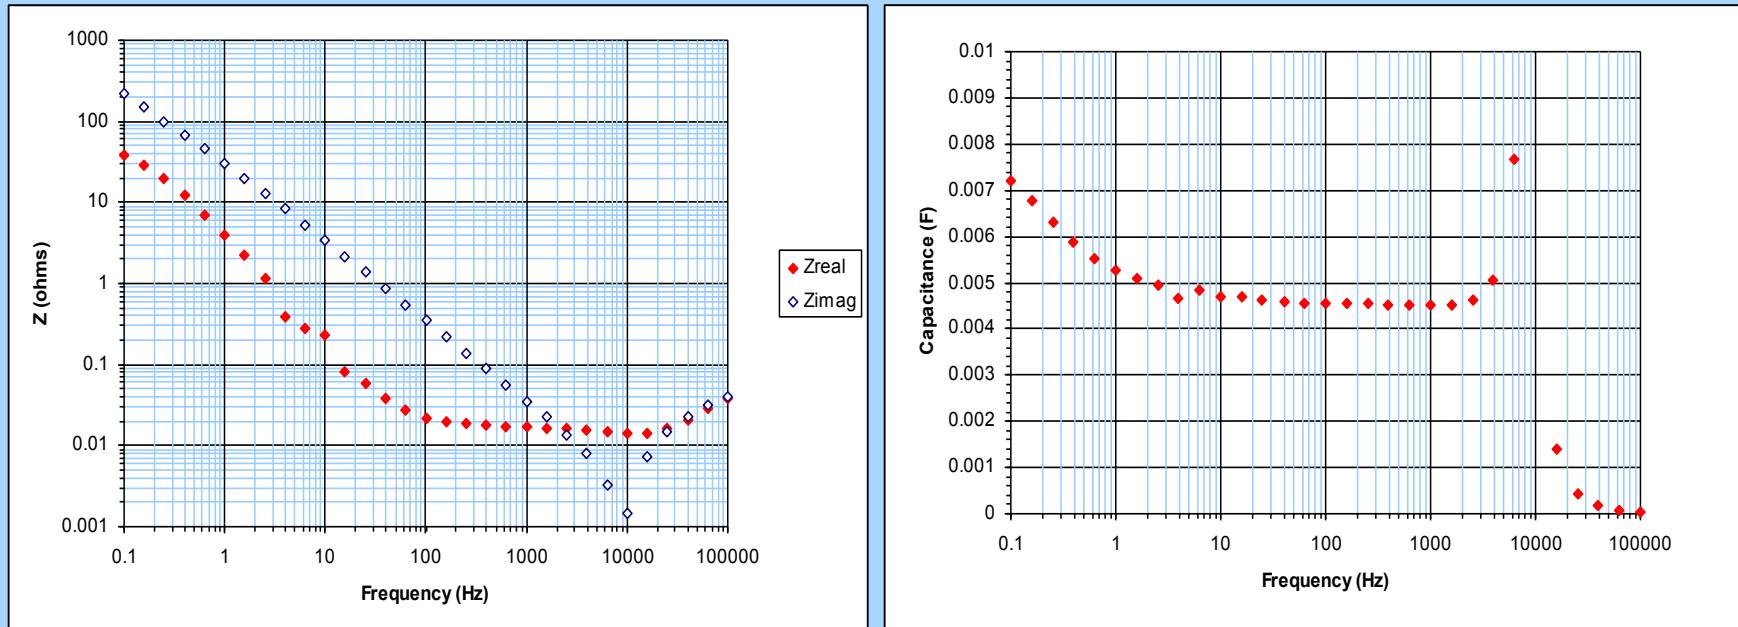

Tantalum Hybrid Capacitor

THQ3

TDD3125

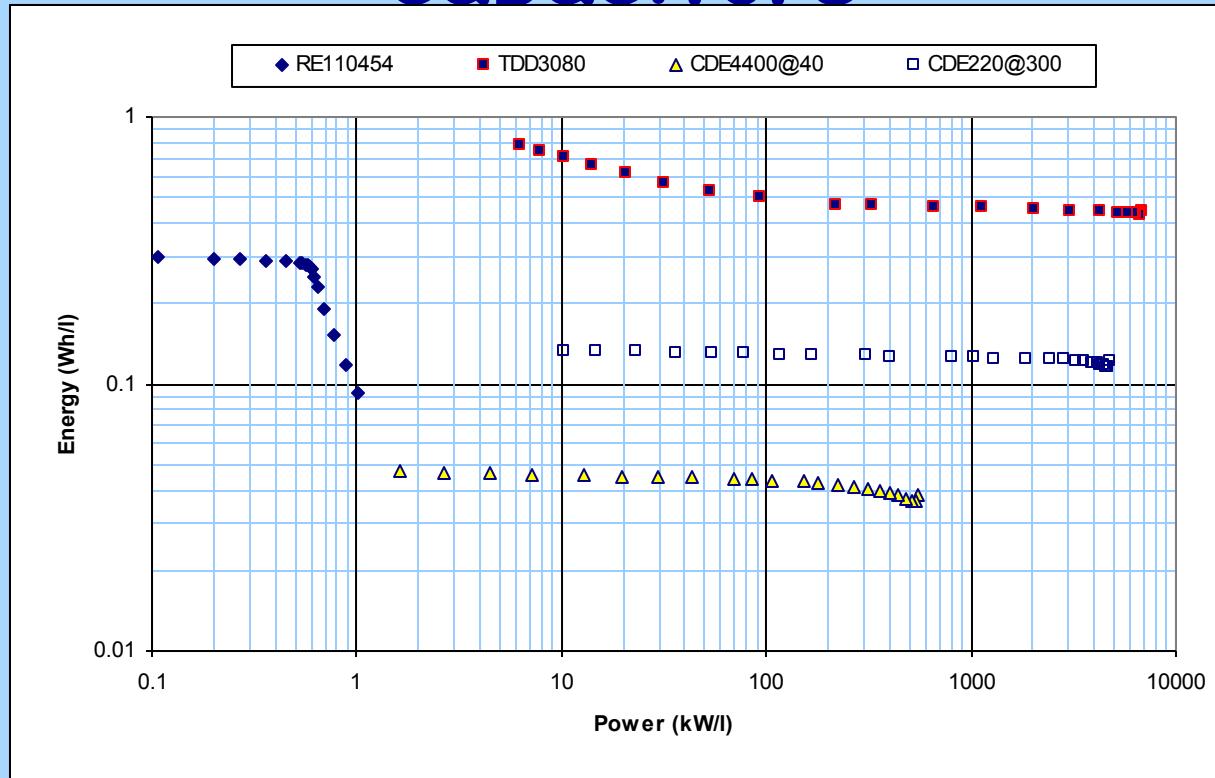

Power

- $P = EI = V^2/R$
- $P_{\text{max}} = V_r^2/4R$
- $P_{\text{max}} \propto 1/R$

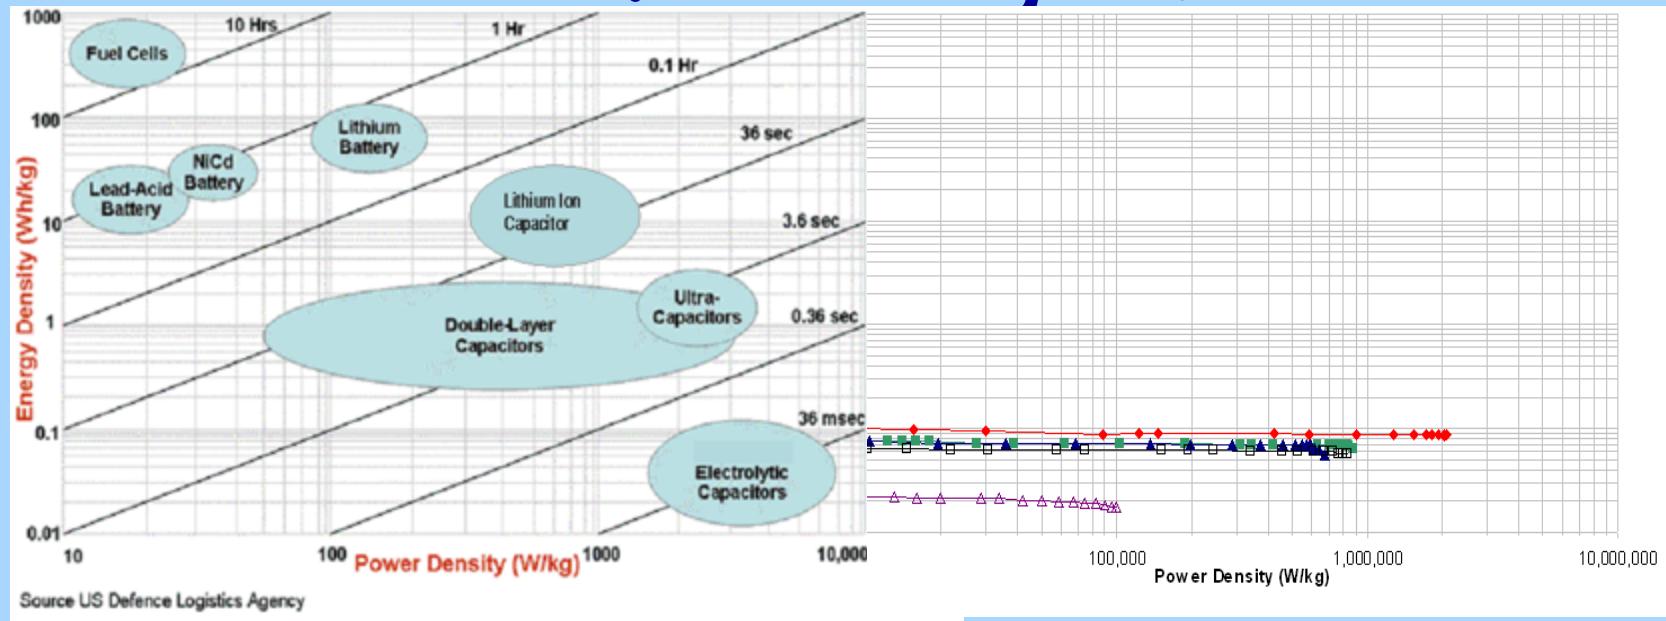

Energy

- $E = \frac{1}{2} CV^2$
- energy is proportional to capacitance at rated voltage

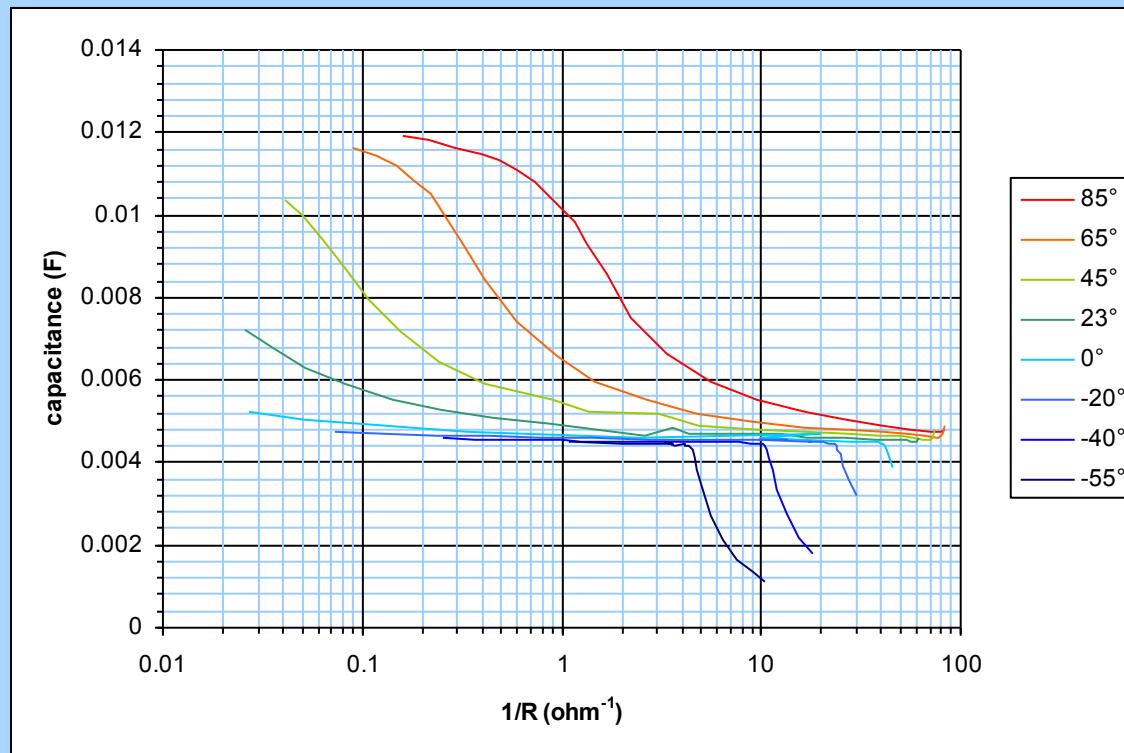

Volumetric comparison of capacitors

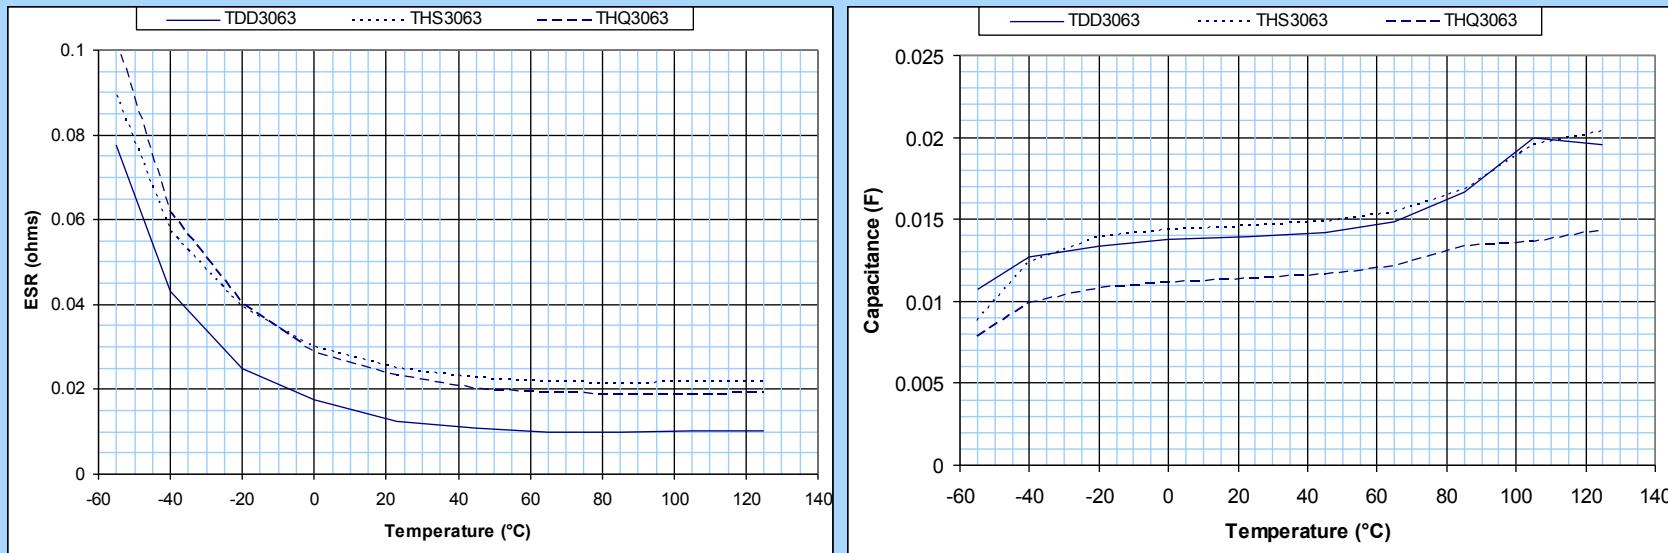

Modified Diagram

TDD3125 at various temperatures

Performance over temperature

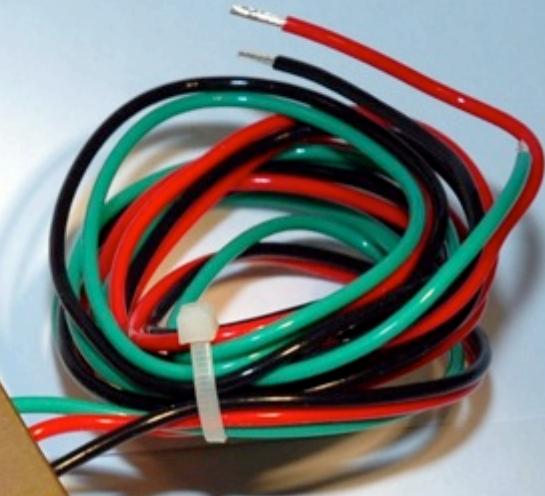

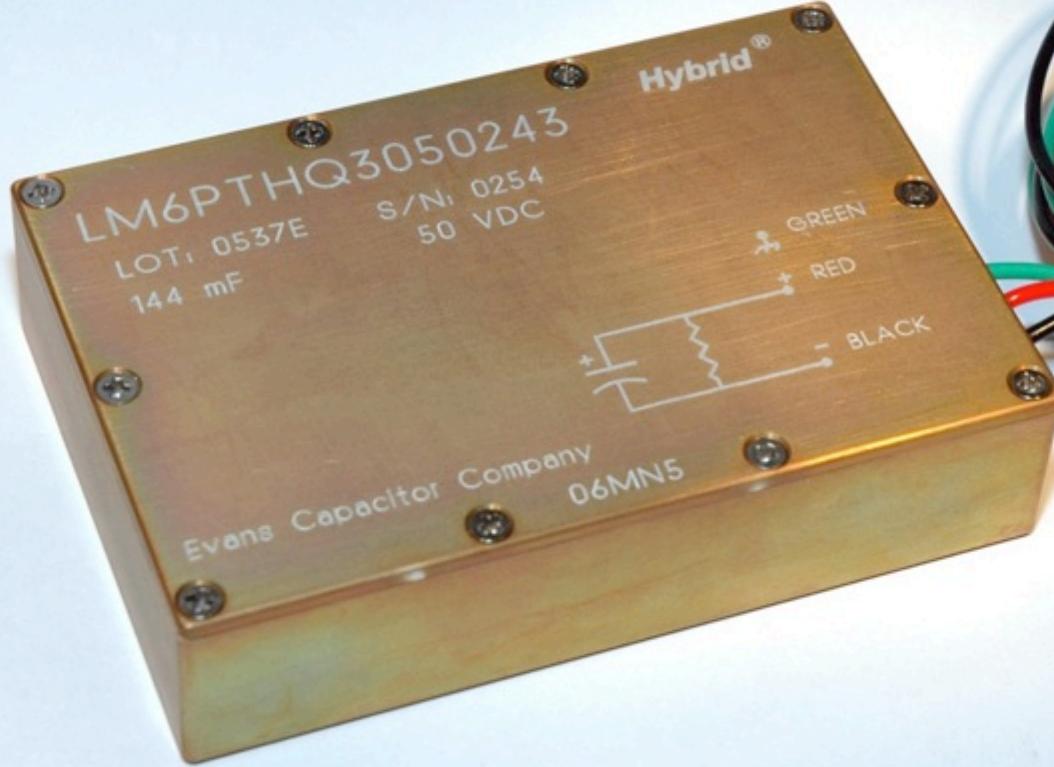

- All parts show marked increase in ESR at temperatures < -20°

THQ5125452
4500uF at 125V

E-2D Hawkeye

THS3125442

TDD3080 into 0.1 ohm

Load Circuit

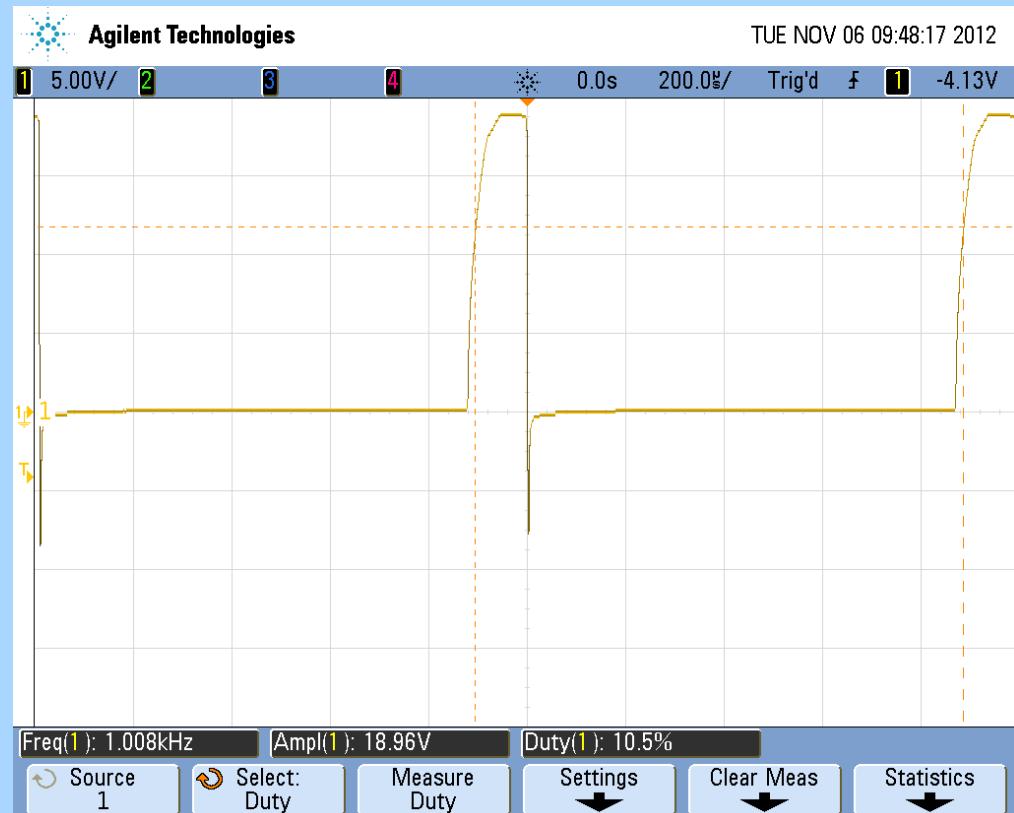

- $R_{\text{tot}} = R_{\text{load}} + R_{\text{switch}}$
 $= 0.06 + 0.04 \text{ ohms}$

Load Profile

- 320A peak 1kHz, 10% duty

Capacitor Performance

- Rise time 35us
- Runs continuous duty with active cooling on capacitor and switch. Higher current exceeds switch capacity

High Temperature HC Caps

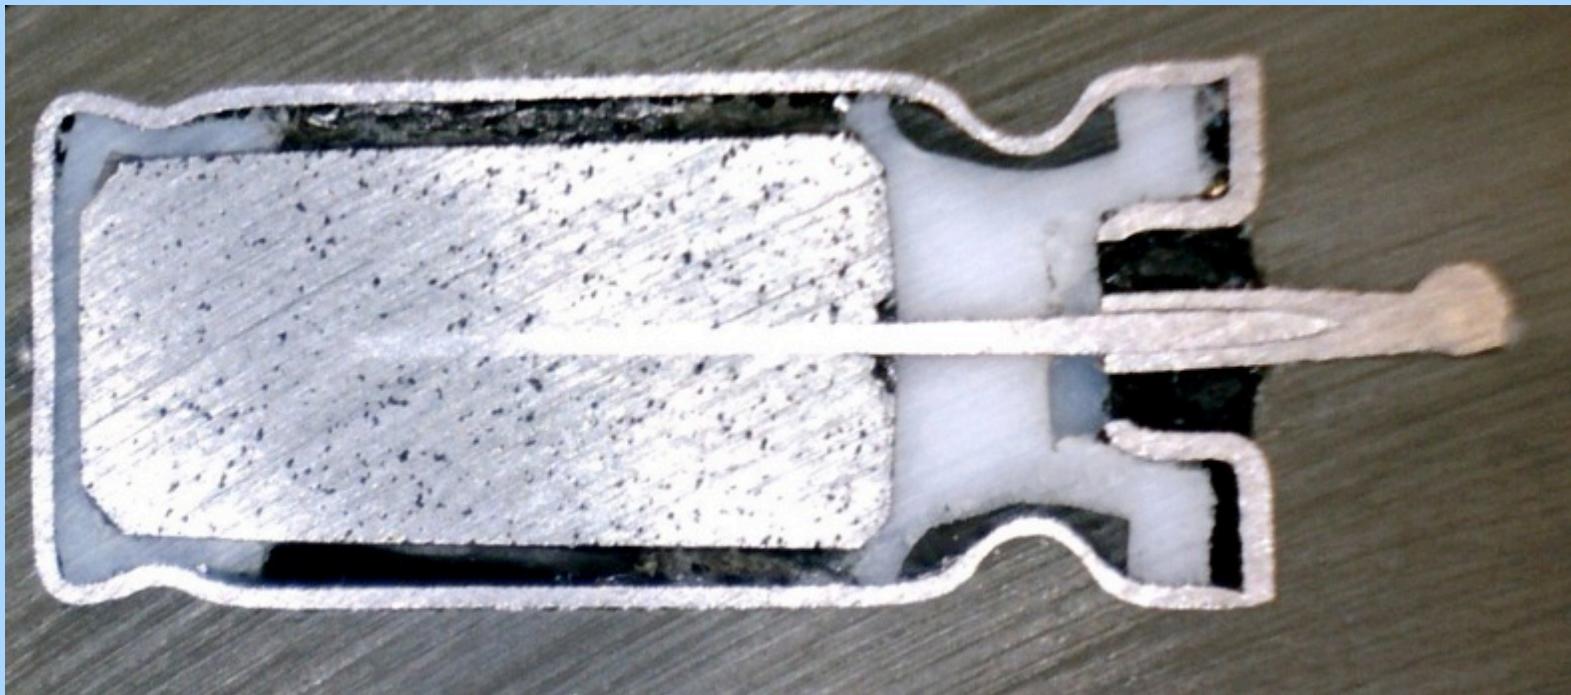

Part Number	C (uF)	Vr 85°	Vr 200°
HC2D075941HT	940	75	37
HC2B060331HT	330	60	30
HC2A100330HT	33	100	50

Part Number	Cap	V (175°C)	V (200°C)	Case Size
HC2A050101HT	100µF	30V	25V	A (T1)
HC2A075560HT	56µF	45V	37V	A (T1)
HC2A100330HT	33µF	60V	50V	A (T1)
HCB075111HT	110µF	50V	45V	B (T2)
HCB100680HT	68µF	70V	60V	B (T2)
HC2B050471HT	470µF	30V	25V	B (T2)
HC2B060331HT	330µF	36V	30V	B (T2)
HC2B075221HT	220µF	45V	37V	B (T2)
HC2B100151HT	150µF	60V	50V	B (T2)
HCD050681HT	680µF	35V	30V	D (T4)
HCD060561HT	560µF	42V	36V	D (T4)
HCD075471HT	470µF	50V	45V	D (T4)
HCD100221HT	220µF	70V	60V	D (T4)
HCD125151HT	150µF	85V	75V	D (T4)
HC2D050152HT	1500µF	30V	25V	D (T4)
HC2D060122HT	1200µF	36V	30V	D (T4)
HC2D075941HT	940µF	45V	37V	D (T4)
HC2D100471HT	470µF	60V	50V	D (T4)
HC2D125331HT	330µF	75V	62V	D (T4)

NOTE: A-case under development; all others currently available

Motor controller for down-hole use

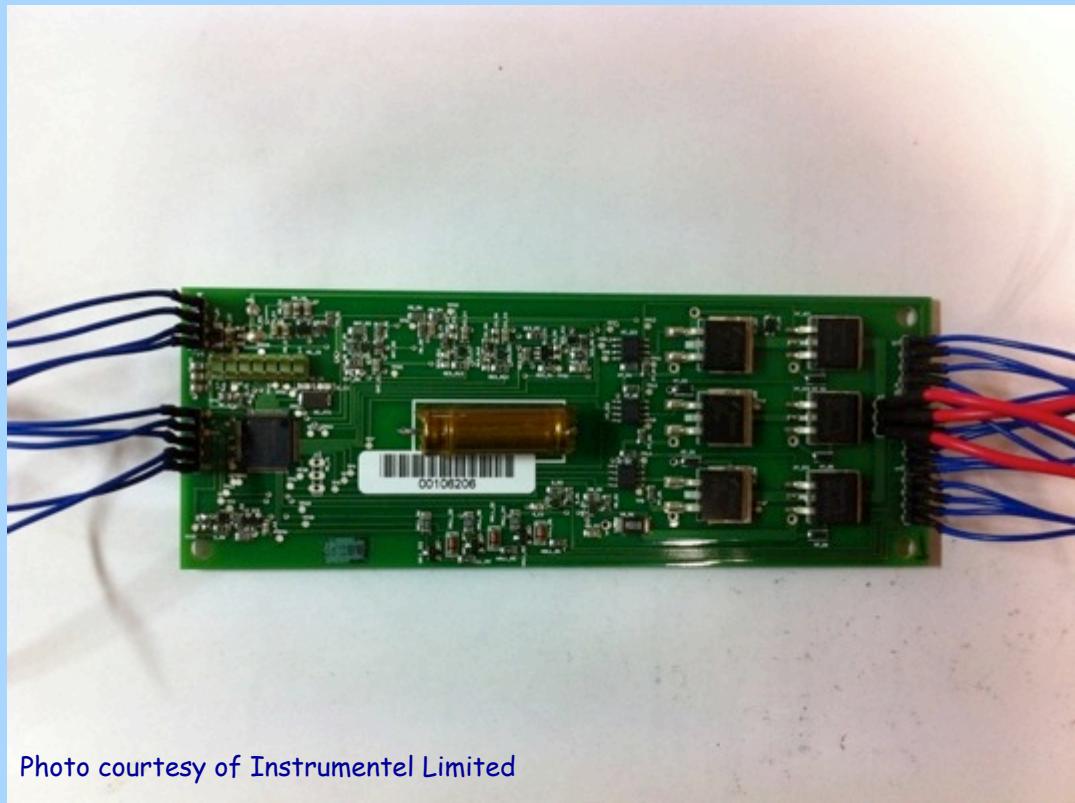

Photo courtesy of Instrumentel Limited

Instrumentel have been tasked with creating a high temperature motor controller circuit for a down well application. The motor controller is capable of driving a number of motor variants, including AC resolvers, although for this application it will control a DC motor. The controller will be able to withstand down-hole environments.

MWD Environment ratings:
Shock Limit 1000g, 0.5ms
Vibration Limit, 20G RMS random
50-500Hz, at 175°C.

The motors for this application require a high drive current, and the Evans capacitor was chosen for its high energy density, lifetime, and voltage capability.

"The location of these decoupling capacitors becomes even more critical in high temperature operations since, in addition to the higher costs, larger valued capacitors become the life limiting component in many high temperature systems. Most capacitor types have falling capacitance values and increasing IR values as the ambient temperature increases which present trade offs when working with capacitors at elevated temperatures. The Harsh Environment Acquisition Terminal Evaluation Module uses a nominal number of capacitors and value of capacitance."

Capacitor Development

- THQ3 (1999) THS3 (2004) TDD3 (2011)
- Half the resistance and better frequency response
- Hermetic seal
- Excellent heat transfer

Summary

- Hybrid capacitors combining a faradaic with an electrostatic electrode have a combination of characteristics that improve performance.
- Wet tantalum hybrid capacitors suitable for high temperatures were developed. Life test results at 1000 hours at 200°C and 50% rated voltage predict life > 2000 hours for HC2D100HT.
- A method using simple measurements for predicting life based on leakage current at voltage and temperature was described.
