

Description

The DPS1113 is part of a family of power switches optimized for USB Power Delivery and other hot-swap applications. Through the analog interface, exception status is reported and several functions can be programmed: current limit, overvoltage protection (OVP), and output voltage ramping up. The device implements the fast role-swap function, which complies with the USB Power Delivery Specification Release 3.0, V1.0a requirement.

This device operates between 4.5V and 5.5V and offers fast short-circuit response time to ensure system robustness. The integrated port-discharge function allows the voltage levels at the input and output ports to be discharged to meet the requirements of the USB Power Delivery Specification. Comprehensive fault detection and recovery mechanisms are provisioned to enable applications, which are subjected to heavy capacitive loads and the risk of short circuit. These mechanisms include reverse voltage & current blocking, input OVP, output overcurrent, short-circuit protection and overtemperature shut-down. In addition, the rise time of output voltage can be adjusted to minimize in-rush current and to ensure system stability. Before any exception condition is notified via the low-active FAULTB signal, deglitch of 7ms is applied to prevent false triggering.

The DPS1113 is housed in the low-profile and space-saving V-QFN4040-17 package, which is manufactured with environmental-friendly material.

Features

- Operating Voltage Range: 4.5V to 5.5V
- 1-Channel Power Switch with Integrated Adjustable Current & Voltage Limits
- Ability to Discharge the Input and Output Ports Either Individually or Simultaneously via the Two External Control Pins
- Fast Short-Circuit Response Time at 2 μ s
- Comprehensive Built-in Fault Detection and Recovery Mechanisms like Input Undervoltage Lock-out, Reverse Voltage & Current Blocking, Thermal Shut-down, Overcurrent and Short-Circuit Protection
- $R_{DS(ON)}$ of Embedded MOSFET at 30m Ω
- Adjustable DV/DT Control at Start-up
- Fault Reporting (FAULTB) with Blanking Time at 7ms Typical
- Fast Role Swap Supported
- UL Recognized, File No. E322375
- IEC60950-1 CB Scheme Certified
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

Notes: 1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3),compliant.
 2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds

Pin Assignments

(Top View)

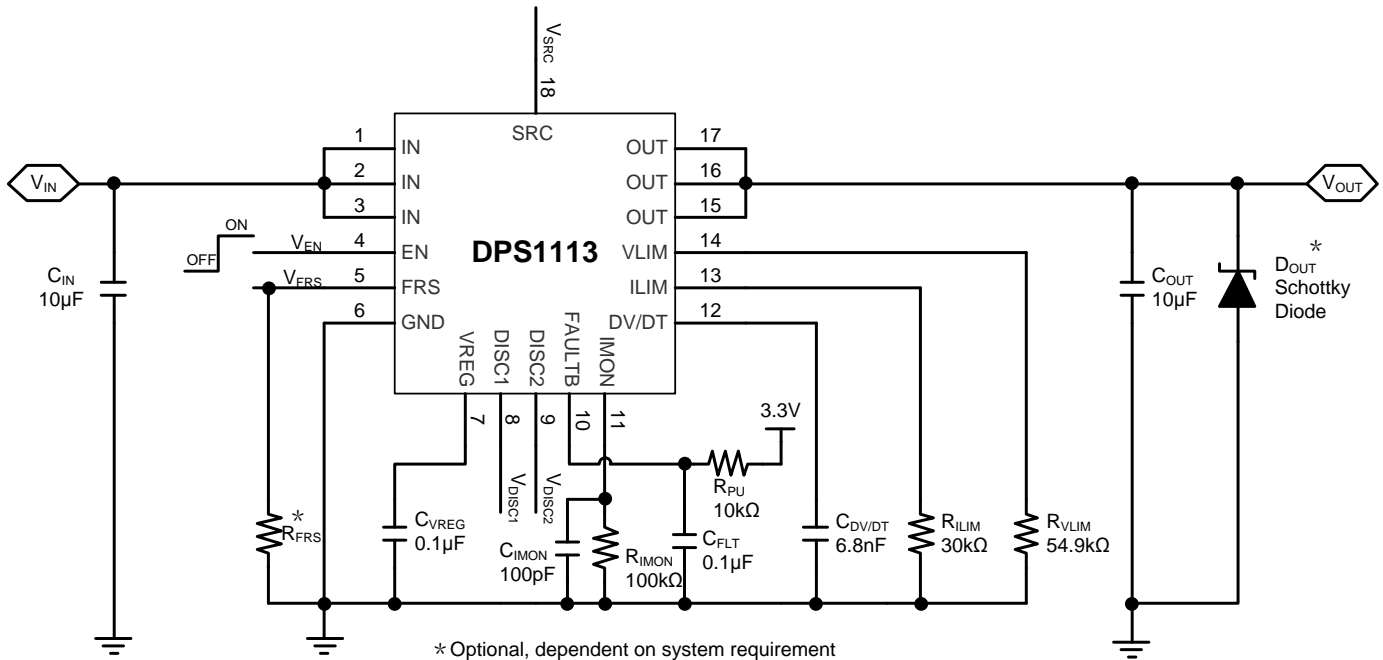

V-QFN4040-17

Applications

- Notebook & Desktop & AIO PCs, Servers, and Tablets
- Docking Stations, Universal & Multimedia Hubs
- FPTVs, PC Monitors
- Set-Top-Boxes, Residential Gateways, Storage Devices

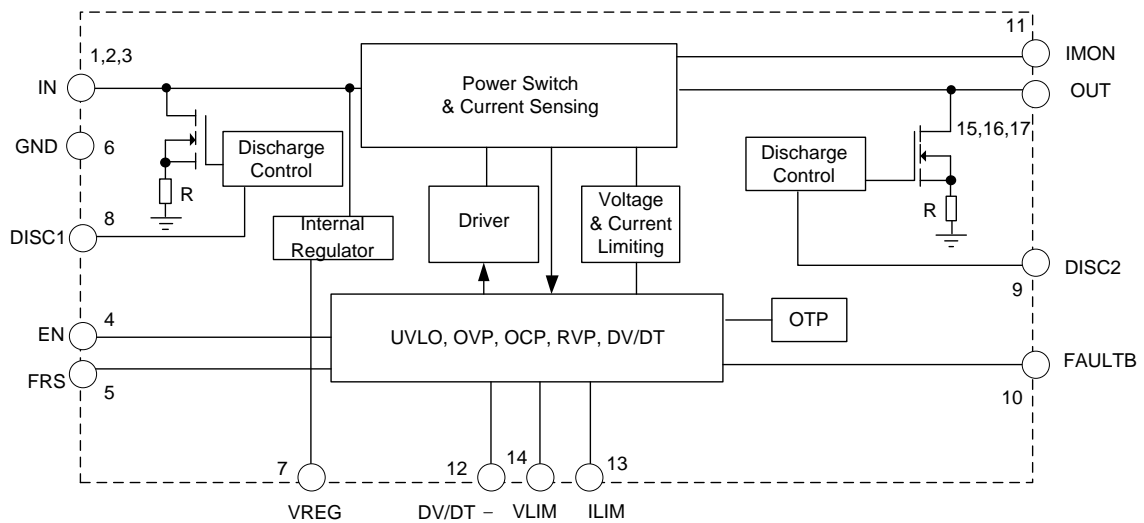

Typical Application Circuit

Pin Descriptions

Pin Number	Pin Name	Type	Function
1, 2, 3	IN	P	Power Supply and Input Port.
4	EN	I	Enable Input. Active high. '0' = Device OFF; '1' = Device ON. This pin must not be left floating.
5	FRS	I	Fast Role Swap Control. This pin enables the Fast Role Swap sequence defined in the USB Power Delivery Specification Release 3.0, V1.0a.
6	GND	GND	Device Ground.
7	VREG	I/O	Voltage Regulator. A 0.1µF is recommended between this pin and GND.
8	DISC1	I	IN Port Discharge Control. '1' = port voltage to be discharged; '0' = disabled.
9	DISC2	I	OUT Port Discharge Control. '1' = port voltage to be discharged; '0' = disabled.
10	FAULTB	O	Fault Status Indicator. An external pull-up resistor is required. This active-low pin must be tied to GND when not used.
11	IMON	O	Current Monitor. A 100pF capacitor and a resistor connected in parallel between this pin and GND creates a positive average voltage proportional to the current flowing through the device. This pin can be left floating if current monitoring is not required.
12	DV/DT	I/O	Ramp-up Control. A capacitor between this pin and GND sets the ramp-up rate.
13	ILIM	I/O	Current Limit Setting. A resistor between this pin and GND sets the overcurrent limit of the OUT port.
14	VLIM	I/O	Voltage Limit Setting. A resistor between this pin and GND sets the overvoltage limit of the IN port.
15, 16, 17	OUT	O	Output Port.
18 (Exposed Pad)	SRC	I/O	Common Source. The exposed pad of the V-QFN4040-17 package must not be connected to any signal.

Functional Block Diagram

Absolute Maximum Ratings (@ $T_A = +25^\circ\text{C}$, unless otherwise specified) (Note 4)

Symbol	Parameter	Rating	Unit
V_{IN}	Voltage Range of Power IN Pin	-0.3 to 7	V
V_{OUT}	Voltage Range of OUT Pin	-0.3 to 30	V
V_{EN}	Voltage Range of EN Pin	-0.3 to 30	V
$V_{I/O}$	Voltage Range of Other Pins (FRS, VREG, DISC1, DISC2, FAULTB, IMON, DV/DT, ILIM, VLIM)	-0.3 to 6	V
I_{OUT}	Load Current Range	5	A
T_J	Operating Junction Temperature	-40 to +125	$^\circ\text{C}$
T_L	Lead Temperature	+260	$^\circ\text{C}$
T_{ST}	Storage Temperature	-65 to +150	$^\circ\text{C}$
ESD	Human Body Model (HBM), JESD22-A114	2	kV
	Charge Device Model (CDM)	1	

Thermal Characteristics (@ $T_A = +25^\circ\text{C}$, unless otherwise specified) (Note 5)

Symbol	Parameter	Rating	Unit
P_D	Power Dissipation	1.7	W
$R_{\theta JA}$	Thermal Resistance, Junction-to-Ambient	58.5	$^\circ\text{C}/\text{W}$
$R_{\theta JC}$	Thermal Resistance, Junction-to-Case	12.3	$^\circ\text{C}/\text{W}$

Notes: 4. These are stress ratings only. Operation outside the absolute maximum ratings can cause device failure. Operation at the absolute maximum rating for extended periods can reduce device reliability.
 5. Device mounted on FR-4 substrate PC board, 2oz copper, with 1" x 1" copper pad layout.

Input OVP and Recovery

$V_{IN} = 5\text{V}$ to 7V then Back to 5V , $R_{LOAD} = 5\text{k}\Omega$

Reverse Voltage Response

$V_{IN} = 5\text{V}$, Supply External 24V to OUT Port

Short Circuit Protection Auto Retry

$V_{IN} = 5\text{V}$, OUT Pin Short to Ground

OUT Always Short to Ground at 5V

$V_{IN} = 5\text{V}$, OUT Port Short to Ground

Application Information

General Description

The DPS1113 is a 1-channel power switch designed to meet the input and output voltage/current requirements that are common with many hot-pluggable serial interfaces found in computing and consumer electronics equipment. For example, DPS1113 is compatible with the USB Power Delivery Specification Release 3.0, V1.0a and many popular USB Type-C™ applications.

Start-up Time

An external capacitor connected from the DV/DT pin to GND defines the slew rate of the output voltage at power-on in the following equation.

$$dV_{OUT} / dt = (I_{DV/DT} / C_{DV/DT}) \times G_{DV/DT}$$

Where:

- dV_{OUT} / dt is the desired output slew rate in V/ms
- $I_{DV/DT}$ is in μA and it is $1\mu A$ typical
- $C_{DV/DT}$ is the ramp-up control setting capacitor in nF
- $G_{DV/DT}$ is the gain of DV/DT to OUT and $G_{DV/DT} = 12$

The total ramp time $t_{DV/DT}$ of V_{OUT} increasing from 0 to V_{IN} can be calculated using the following equation.

$$t_{DV/DT} = 8.3 \times 10^{-2} \times V_{IN} \times C_{DV/DT}$$

Where:

- $t_{DV/DT}$ is the total ramp time in ms
- V_{IN} is in volts
- $C_{DV/DT}$ is nF

Choosing a proper value for the capacitor $C_{DV/DT}$ ensures the device is turned ON with the preset ramp up imposed over the output voltage. The regulated output voltage ramp or the limited current setting limits the in-rush current at power up.

Input Overvoltage Protection (OVP)

The voltage at the IN port is monitored continuously. The built-in OVP fault-handling mechanism triggers when the voltage at the IN port is larger than the V_{OVPRTH} value. The internal power MOSFET turns OFF to protect the downstream connected equipment. The V_{OVPRTH} value is determined by the following equation.

$$V_{OVPRTH} = 0.1 \times R_{VLIM} + 0.5$$

Where:

- V_{OVPRTH} is in volts
- R_{VLIM} is k Ω
- $51k\Omega \leq R_{VLIM} \leq 56k\Omega$

Reverse-Voltage Protection (RVP)

The difference in voltage ($V_{IN} - V_{OUT}$) between the IN and OUT ports is monitored continuously. Once the voltage difference drops below the V_{RVPFTH} level, the device immediately turns OFF the internal power MOSFET to prevent the current flowing from the opposite direction. When the reverse-voltage condition is no longer valid, that is ($V_{IN} - V_{OUT}$) becomes greater than the V_{RVPFTH} level, the internal power MOSFET must be turned ON.

Overtemperature Protection (OTP)

During overload conditions, the output voltage drops with the limited current I_{LIM} , which results in the increasing junction temperature T_J with the increased power consumption on device. When T_J reaches the thermal shutdown threshold T_{SHDN} , the internal power MOSFET turns OFF. The internal MOSFET turns ON again once the condition [$T_J < (T_{SHDN} - T_{HYS})$] occurs.

Application Information (Cont.)

Overcurrent Protection (OCP)

The output current is monitored continuously. Whenever the output current I_{OUT} is larger than the I_{LIM} value by over $2\mu s$, the embedded-OCP fault-handling mechanism triggers. This action results in the output current clamping at the I_{LIM} value hundreds of microseconds later and in the voltage dropping at the OUT port. R_{ILIM} sets the I_{LIM} value.

$$I_{LIM} = 100 / R_{ILIM}$$

Where:

- I_{LIM} is in amperes,
- R_{ILIM} is $k\Omega$
- $27k\Omega \leq R_{ILIM} \leq 200k\Omega$

R_{ILIM} ($k\Omega$)	I_{LIM} (A)		
	Min	Typ.	Max
200	0.50	0.55	0.7
100	0.90	1.05	1.20
66.7	1.35	1.50	1.65
50	1.80	2.00	2.20
40	2.25	2.50	2.75
33.3	2.76	3.00	3.24
28.6	3.22	3.50	3.78

Short-Circuit Protection (SCP)

There are two behaviors to protect device under short-circuit conditions. The first is fast-trip current detection. When the output current exceeds the fast-trip threshold $I_{FASTRIP}$, the device switches OFF the internal MOSFET.

$$I_{FASTRIP} = 1.125 \times I_{LIM} + 1.8$$

Where:

- $I_{FASTRIP}$ is in amperes
- I_{LIM} is in amperes

The other behavior is low-output voltage detection. During heavy overload or short-circuit conditions, the output current is limited to I_{LIM} , and the output voltage would drop quickly. When the output voltage drop exceeds the capability of MOSFET, the power switch turns OFF. The device is operating in auto-retry mode, and the cycle time is approximately 128ms.

Adjustable Current Monitoring Output (IMON)

A 100pF capacitor and a resistor R_{IMON} connected in parallel between the IMON pin and GND generates an average current-monitor output voltage V_{IMON} , which is proportional to the load current flowing through the device.

$$V_{IMON} = 10^{-3} \times G_{IMON} \times R_{IMON} \times I_{OUT}$$

Where:

- G_{IMON} is the ratio of the IMON to the load current in $\mu A/A$ and $G_{IMON} = 10$
- V_{IMON} is in volts
- R_{IMON} is $k\Omega$
- I_{OUT} is in amperes

The resistor R_{IMON} ensures that the voltage at the IMON pin is less than 4.5V under the maximum load current I_{LIM} . For example if R_{IMON} is 100k Ω , there is a 1V output on IMON pin at 1A load, and $V_{IMON} = 3V$ at 3A load. Connecting this IMON pin to an analog-to-digital converter (ADC) can help monitor the current information of a system.

Fault Response

An external pull-up resistor is required. The device generates a warning flag whenever one of the following fault conditions becomes valid: input overvoltage, reverse voltage, overtemperature, short circuit, overcurrent, and ILIM pin short to ground. After a de-glitch time out of 7ms, the low-active FAULTB signal must be asserted. The FAULTB signal must remain at *low*, and the internal power MOSFET remains OFF until the device exits from the exception status.

Application Information (Cont.)

Support of Fast Role Swap (FRS)

The DPS1113 supports the Fast Role Swap (FRS) operation. This operation allows the system to change its role from a power consumer to a power provider within the time limit defined in the USB Power Delivery Specification Release 3.0 V1.0a. Regardless of the voltage level at the EN pin, the relevant FRS control circuit inside the device enables at the rising edge of any positive pulse appearing at the FRS pin. When the pulse width (t_{FRS_ON}) is found to be larger than $600\mu s$, the internal power MOSFET must be turned ON within $60\mu s$ from the falling edge of the pulse in the absence of the reverse-voltage condition. At the end of the $60\mu s$, the voltage level at the OUT port must be 90% of the voltage level at the IN port. Thereafter, while a subsequent rising edge at the EN pin must always be ignored, the occurrence of a falling edge disables the device. After the device shuts down, it will not resume proper operation until a rising edge appears at either the EN pin or the FRS pin.

Figure 1. FRS Control Sequence for Fast Role Swap, Power Switch ON at Falling Edge of FRS Signal after Exiting RVP Condition

Figure 2. FRS Control Sequence for Fast Role Swap, Power Switch ON when Exiting RVP Condition after FRS is Triggered (Falling Edge)

Application Information (Cont.)

Discharge Function

To facilitate the various applications envisioned by the system designers, the input or output port can be discharged via two external controls: DISC1, DISC2. The internal discharge resistor at each port is approximately 100Ω. The discharge paths are OFF by default with an internal 1MΩ pull-down resistor between DISC1 (or DISC2) and GND. The settings are shown in the following table.

DISC1	DISC2	Description
0	0	Discharge function disabled
0	1	OUT port is being discharged until the pin DISC2 is pulled <i>low</i>
1	0	IN port is being discharged until the pin DISC1 is pulled <i>low</i>
1	1	Both IN and OUT ports are discharged simultaneously

Schottky Diode for Protection of Current Surge

When a cable is hot plugged in/out of the USB Type-C connector behind where the OUT port of the DPS1113 is connected, a large ground current can be seen at the OUT port of the DPS1113. When the far end of a connected cable is short to ground for whatever reason, the OUT port of the DPS1113 can also detect a large ground current. With the Schottky diode, SBR3U40P1, populated as close as possible to the USB Type-C connector, no ground current can go through the DPS1113 to cause false operation.

Printed Circuit Board (PCB) Layout Consideration

- Place the input/output capacitors C_{IN} and C_{OUT} as close as possible to the IN and OUT pins.
- The power traces (V_{IN} trace and the V_{OUT} trace), including the power ground, is kept direct, short and wide.
- Place the resistors and capacitors (R_{VLIM} , R_{ILIM} , R_{IMON} , C_{IMON} , $C_{DV/DT}$ and C_{VREG}) near the device pins.
- Connect the signal ground to the GND pin, and keep a single connection from GND pin to the power ground behind the input or output capacitors.
- For better power dissipation, via holes are recommended to connect the exposed pad's landing area to a large copper polygon on the other side of the printed circuit board. The copper polygons and exposed pad of SRC (common source nodes of internal power MOSFET) must not be connected to any of the signal and power grounds on the PCB.

IMPORTANT NOTICE

DIODES INCORPORATED MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARDS TO THIS DOCUMENT, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION).

Diodes Incorporated and its subsidiaries reserve the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. Diodes Incorporated does not assume any liability arising out of the application or use of this document or any product described herein; neither does Diodes Incorporated convey any license under its patent or trademark rights, nor the rights of others. Any Customer or user of this document or products described herein in such applications shall assume all risks of such use and will agree to hold Diodes Incorporated and all the companies whose products are represented on Diodes Incorporated website, harmless against all damages.

Diodes Incorporated does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel. Should Customers purchase or use Diodes Incorporated products for any unintended or unauthorized application, Customers shall indemnify and hold Diodes Incorporated and its representatives harmless against all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized application.

Products described herein may be covered by one or more United States, international or foreign patents pending. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks.

This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes Incorporated.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
